Market Briefs **Pro**

Read less news

Good morning, Pro Briefers!

With all the buzz around AI, you may think of Hollywood movies like Terminator or The Matrix, but experts assure us that ChatGPT just isn't that kind of AI...*at least not yet.*

Major tech companies are trying to level up their AI game, working on what's called Artificial General Intelligence (AGI).

It's AI that can learn information, not just show it to you. And even teach itself new things.

This is where we've identified a Main Street Shift: Tech companies are racing to develop AGI, shifting spending into development, infrastructure, and products that could use the tech.

Narrow AI	General AI
Inferior To Human Intelligence	Similar To Human Intelligence
Also Known As Weak AI	Also Known As Strong AI Or Full AI
Lacks Artificial Consciousness Or Cognitive Abilities	Has Human-Like Consciousness And Cognitive Abilities
IBM Watson, AlphaGo, And Google Assistant Are Some Examples	Yet To Become A Reality
Can't Solve Unfamiliar Problems	Can Solve Unfamiliar Problems

 Market Briefs Pro

Data [via](#) Tech Target

Why the rush? AGI could solve complex problems that top scientists struggle with, and the first company with a working AGI model could corner the market and reap the rewards.

To better understand this technology, we spoke to Neil Sahota.

Neil was a member of the IBM Watson team, which is responsible for the current generation of AI, and currently serves as the AI advisor to the United Nations.

When asked to define AGI, Neil said:

“[It] has the ability to learn things on its own. It can expand its repertoire. If it’s feeling bored, it might say, ‘You know what? I’m going to teach myself to fly a helicopter.’”

Let’s be clear: Right now, AGI doesn’t exist. What does exist are major

investments and integrations that a savvy investor may be able to capitalize on.

Have some feedback? Let us know your thoughts on this Shift by responding directly to this email!

DEVELOPERS

Big Tech and AGI Development

Existing AI companies are all in a race, wanting to be the first that develop a functioning AGI system.

Developing the next generation of AI is expensive and requires the top minds in the industry.

So it's no surprise that it's the largest names in tech who are headed towards the finish line.

Who's in the race? Companies like Microsoft, Amazon, and Google are leading the way in AGI development.

But they aren't developing it directly - these tech giants are buying out or partnering with privately held developers.

These partnerships often come with exclusive rights. We can see this in Microsoft's (MSFT) AGI partnerships.

It's common knowledge that Microsoft is one of the biggest investors in OpenAI.

Microsoft Subsidiaries

Microsoft Is Among The Largest Companies On Earth, With A Diversified Portfolio. Owned By Billionaire Bill Gates, Microsoft Acquired Other Companies Like LinkedIn, GitHub, Skype, And More Over The Years. Today, Microsoft Is A Tech Empire That Spans Software, Social Media, Gaming, And More.

 Market Briefs Pro

Data [via](#) Microsoft

- Microsoft has invested more than \$13 billion in OpenAI since 2019.

Microsoft receives 20% of OpenAI's top-line revenue until a large portion of its investment is recouped.

In addition, Microsoft's contract says that OpenAI is required to build its AI systems on Microsoft technology, specifically its Azure platform.

It also states that Microsoft gets *exclusive rights* to OpenAI's AGI developments.

What does this mean?

Microsoft effectively owns OpenAI's AGI program, and they're already reaping some of the benefits.

This exclusivity agreement has let Microsoft take OpenAI's early developments and use them to integrate what's called "AGI-lite" into several of its products.

Definition: While AGI doesn't exist, AGI-lite simulates AGI by running several AIs at once.

The result is Microsoft 365 Copilot.

Copilot has integrations into programs like Word, Excel, and PowerPoint, and is often cited as the most advanced AI on the market.

Data [via](#) Microsoft

This means that if OpenAI wins the AGI race, not only will Microsoft have exclusive infrastructure rights, but they're also able to leverage any developments along the way for profit.

Microsoft is a multi-trillion-dollar giant, and it's very difficult for a single partnership such as OpenAI to move their needle, but we've seen their share prices increase significantly since the partnership began.

Microsoft Corporation (MSFT)

449.26
(+8.32%)

1 Year Price →

 **Market Briefs Pro**

Data [via](#) Yahoo! Finance

- Microsoft is up 8.3% in the last year and 123% since 2020.

Microsoft isn't the only tech giant making investments in AGI companies. Amazon (AMZN) and Google (GOOG) have both backed AGI developer Anthropic.

Anthropic is the private company behind Claude AI, and one of OpenAI's main competitors in the race to an AGI model.

Similarly to Microsoft's investment in OpenAI, Amazon has invested \$8 billion in Anthropic in exchange for benefits.

And their main driver of revenue is their cloud-based service Azure - the very same product that OpenAI must use as part of their agreement.

As of their latest report, Azure's revenue is up 30% year-over-year.

Claude's Capabilities

Advanced Reasoning

Claude Can Perform Complex Cognitive Tasks That Go Beyond Simple Pattern Recognition Or Text Generation

Vision Analysis

Transcribe And Analyze Almost Any Static Image, From Handwritten Notes And Graphs, To Photographs

Multilingual Processing

Translate Between Various Languages In Real-Time, Practice Grammar, Or Create Multi-Lingual Content

Code Generation

Start Creating Websites In HTML And CSS, Turning Images Into Structured JSON Data, Or Debugging Complex Code Bases

Market Briefs Pro

Data [via](#) Anthropic

- Anthropic has agreed to make Amazon's web service (AWS) its primary cloud infrastructure.
- Anthropic is developing its AGI on AWS microchips.
- Early AGI features are being integrated into Amazon's Alexa.

Similarly to Microsoft, AWS cloud services are a major and rapidly growing part of Amazon's revenue.

Amazon Web Services Quarterly Revenue (Q1 2014 - Q2 2024)

Market Briefs Pro

Data via Statista

If Anthropic wins the AGI race, Amazon has positioned itself for growth through both cloud services and microchips.

Amazon.com, Inc. (AMZN)

(+11.29%)

 Market Briefs Pro

Data [via](#) Yahoo! Finance

Amazon has made the largest investment in Anthropic, but there's another tech company that holds more equity.

Google has invested \$3 billion in Anthropic, and while this is significantly lower than Amazon's \$8 billion, they've secured 14% ownership of the company, more than Amazon's undisclosed minority stake.

Wait, less money but more equity?

Yes, Google owns more of Anthropic than Amazon, but it has fewer benefits.

More than exclusive usage rights, Google is co-developing AI systems with Anthropic.

What does this mean? Anthropic's innovations also benefit Google AI systems.

And while Google doesn't have the rights to Anthropic's potential AGI model, its 14% equity means that if Anthropic takes off, Google could be looking at some serious capital.

It's no secret that private AI companies like OpenAI and Anthropic have been looking at eventual IPOs.

If and when this happens, they'll be at the forefront of both the existing AI industry and the in-development AGI.

But for now, investors seeking to invest in AGI development are limited to major tech companies.

HARDWARE

AGI Infrastructure

Neil told our team that the largest roadblock to AI was capital:

"It takes an extraordinary investment, extraordinary people power...If you have a company, say 'You know what, I'm going to drop \$100 million a month in AI' and we might have it in 7 years."

While no one is spending **that** much money on AGI development, there are still hundreds of millions being spent on its development per year.

Where is that money going? In addition to hiring the greatest minds in AI, it goes to things like microchips and servers that are critical for AGI development.

So while there's currently no ROI for the companies developing AGI, it's big business for companies selling servers and computer chips.

Without a doubt, the leading name in AGI computing parts is Nvidia (NVDA).

Nvidia's Blackwell platform is considered to be the global standard for all forms of AI, including AGI development.

In addition to Blackwell, Nvidia develops the turnkey computers that train AGI models, the high-speed networking that AGI requires, and the software used for AI model training.

- OpenAI, Anthropic, Google DeepMind, and Meta AI are **all** built and trained on Nvidia systems.

Developing Secure And Stable Edge AI Efficiently Through End-To-End Software & Services

NVIDIA AI Enterprise

Data [via](#) Nvidia

Its AI dominance has made Nvidia one of the hottest stocks of the past few years, with share prices up more than 1,300% since 2021.

But lately, Wall Street's favor has started to waver, and share prices are down more than 22% in 6 months.

 Market Briefs Pro

Data [via](#) Yahoo! Finance

Is Nvidia on its way down? Not necessarily.

Our analysts believe that Nvidia shares were priced a bit high going into 2025 in the face of limited supply and uncertain markets.

But currently, Nvidia still dominates the AI market. If AGI breakthroughs were to happen in the near future, they would be on Nvidia hardware and Nvidia servers.

Whenever AGI rises to the occasion, Nvidia will rise with it.

Of course, Nvidia's success has paved the way for a fair number of competitors, the biggest of which is Advanced Micro Devices (AMD).

A long-time competitor of Nvidia in the gaming industry, AMD is also rapidly developing its AI infrastructure.

The same, but different. AMD is developing many of the same products as Nvidia - microchips, turnkey computers, and training software - but with a few key differences.

AMD is positioning itself as a more open platform than Nvidia, with easier integration to other systems and fewer barriers to development.

The result? Rapidly growing revenues.

Data [via](#) company reports

- AMD's revenue grew from \$9.76 billion in 2020 to \$25.79 billion in 2024, marking a **2.65x increase** over four years.

This approach has been drawing attention from some of those AGI-focused tech giants.

- Amazon AWS and Microsoft Azure have been increasing their number of AMD-powered AI servers.

With Nvidia unable to keep up with demand, AMD has risen to the occasion, and with each additional year AGI spends in development, AMD's market share seems to grow.

We don't know how much longer it will be until there's a functioning AGI model, but given enough time, AMD could be a dominant force in AGI infrastructure.

Data [via](#) Yahoo! Finance

While NVIDIA and AMD compete directly in the AGI space, Broadcom (AVGO) has become the dominant supplier of ethernet and optical networking for AGI.

Data centers for AI have become big business due to the massive amounts of data that the technology needs to transmit back and forth.

AGI development involves **even more data**. AGI requires data sets that are only made possible from things like quantum computing.

Think of it like several AI networks all connected to each other. Broadcom is currently the top provider of these network connectors.

Google, Amazon, and Microsoft all depend on Broadcom's technology and design services to keep their operations running.

Without this high-speed networking? AGI development just isn't possible.

AGI companies may have a choice between NVIDIA and AMD, but for networking, they're all using Broadcom tech.

Data [via](#) Yahoo! Finance

Money sunk into AGI development will only fuel Broadcom's continued growth.

Forward Thinkers

While any working AGI might be several years away, that hasn't stopped some companies from looking at how they can integrate it.

Staying practical: Analysts have been critical of tech developments for a lack of direct application.

- Nvidia CEO Jensen Huang has made public statements about quantum computing's lack of commercial application.

But AGI has companies preparing to integrate it before the technology even exists.

Some companies are building products with AGI integration in mind, so they'll be able to plug-and-play AGI into their existing AI models without rebuilding or retraining them.

One company banking on AGI development is C3.ai (AI).

C3.ai is one of the only pure-play AI companies on the open market and specializes in helping major enterprises utilize AI.

What does that mean? They sell a platform that helps companies train AI and machine learning programs, so companies can use AI without hiring coders.

And demand for C3's service has been high, with subscription revenue increasing from \$206 million in 2022 to \$278 million in 2024.

But despite growing revenue and shrinking liabilities, C3 has been operating at a heavy loss.

C3.AI 2024 Expenses

Operating Expenses

<i>Sales And Marketing</i>	214,167	183,121	173,584
<i>Research And Development</i>	201,365	210,660	150,544

Provision For Income Taxes	792	675	789
Net Loss	\$ (279,696)	(268,839)	(192,065)

 Market Briefs Pro

Data [via](#) Company Reports

- C3's net loss has increased from \$192 million in 2022 to \$278 million in 2024.

Why? Heavy research and development costs.

Spending over \$200 million a year on R&D, C3 is developing its platform to be able to integrate more powerful models as needed.

This would allow it to have seamless integration for not just AGI, but any next-generation AI models that come out, while many companies will have to build their platforms from scratch.

Even companies from outside the AI industry are preparing to integrate AGI models. Most notably, Salesforce (CRM).

Salesforce has been a strong advocate for the use of AI, being one of the first customer relationship management companies with major AI integration.

Data [via](#) Salesforce

Its rapid development of AI systems has helped the company bounce back from a recent lull, with share prices nearly doubling since mid-2023.

What does this have to do with AGI?

Salesforce has said it plans on having AI models manage customer relations on behalf of their clients, as well as doing complex forecasting and decision-making.

If that sounds a little like an AGI system, *that's because it is.*

Salesforce, Inc. (CRM)

 Market Briefs Pro

Data [via](#) Yahoo! Finance

Salesforce believes that the future of its product lies with AGI development and has been ramping up its AI integration to keep up with the latest developments.

RISKS

Wishful Thinking

This technology doesn't exist.

We're not even sure that functioning AGI is possible or will work as we hope it will.

Rodney Brooks, a famed roboticist at MIT and cofounder of iRobot, says he doesn't expect a functioning AGI model until the year 2300.

“It is a fraught time understanding the true promise and dangers of AI. Most of what we read in the headlines...is, I believe, completely off the mark.” Says Brooks.

There are billions of dollars being spent on AGI research, and an ever-growing amount of hype in the media.

But those dollars? They might not amount to anything, at least not in our lifetime.

There are also major ethical concerns about AGI platforms.

These would be robots that could process complex thought, and many experts believe that there's no guarantee an AGI's goals would align with human interests.

This could lead to strict regulations, inefficient programs...*or the Terminator movies.*

REVIEW

AI is advancing

Hollywood doomsday aside, AGI is largely considered to be the next evolution of AI technology.

Some even believe it's a major catalyst for human development. And while that seems like a lofty goal, very tangible dollars are being spent on it right now.

As a result? The economic shift from this technology is already underway.

Whether it's Microsoft implementing new developments from cutting-edge research or AMD cashing in on short supply, dollars are already moving.

AGI might come in a few years (or a few hundred years), but the research into it is causing rapid development in AI, and even if AGI is a pipedream, profits for investors could be very real.
